Discrete Mathematics Lecture Notes (WS18/19)

Created by Liang Chun

Lecture 1 (10.10.2018)

Prelude: Motivation

What is the aim of the lecture?

Learn basic frameworks used in all areas of mathematics:

- Mathematicians deal with statements
- Usually the statements are about numbers
- The statements may be true or false
- To descide whether a statement is true or false requires a proof
- Use this framework to acquire some knowledge about principles of counting
- Graph theory has a direct application in real world problems
- The basic knowledge about algebraic methods will be used in coding theory

Example:

- 1. 15 is a multiple of 3
- 2. 20 is a multiple of 3

Theorem: 15 is a multiple of 3

Proof: 15 = 3 * 5

Chapter 1: Principles of Counting

Basic Counting Problems

- Permutation: $\frac{n!}{(n-r)!}$ Combinations: $\frac{n!}{(n-r)!r!}$

Definition 1.2.1

Remarks

Supose that X and Y are sets. We say that we have a function/map from X to Y if for each $x \in X$ we can specify a unique element in Y, which we denote by f(x).

- f(x) is defined $\forall x \in X$
- these are just one such object $\forall x \in X$

Inverse Image Example

Given the function

$$f: \{1, 2, 3\}' \mapsto \{a, b, c, d\}$$
 (1)

defined by

$$f(x) = \begin{cases} a, & \text{if } x = 1\\ a, & \text{if } x = 2\\ c, & \text{if } x = 3 \end{cases}$$
 (2)

The produced map is:

$$\begin{array}{cccc}
a & \rightarrow & 1 \\
a & \rightarrow & 2 \\
b & & & \\
c & \rightarrow & 3 \\
d
\end{array}$$
(3)

The image/inverse image of the following sets under f are:

- 1. set $\{2,3\}$; image: $\{a,c\}$
- 2. set $\{a\}$; inverse image: $\{1,2\}$
- 3. set $\{a, b\}$; inverse image: $\{1, 2\}$
- 4. set $\{b, d\}$; inverse image: \emptyset

Definition 1.2.2 Cardinality

A set A is finite if a bijective mapping $A \mapsto \{1, ..., n\}$ exists. (This means that there a exactly n number of elements inside set A).

In this case n is called the **cardinality** of A and A has |A| := n elements.

Two sets A, B are defined to have the same cardinality if a bijective mapping $A\mapsto B$ exists.

Not Disjoint Sets

1.
$$A = \{1, 2, 3, 4, 5\}, |A| = 5$$

2.
$$B = \{3, 4, 5, 6, 7\}, |B| = 5$$

$$|A \cup B| \tag{4}$$

$$= |1, 2, 3, 4, 5, 6, 7| \tag{5}$$

$$=7\tag{6}$$

$$\neq |A| + |B| \tag{7}$$

Counting Sets

1.
$$|X \cup Y| = |X| + |Y| - |X \cap Y|$$

2.
$$|X \cup Y \cup Z| = |X| + |Y| + |Z| + (|X \cap Y| + |X \cap Z| + |Y \cap Z|) + |X \cap Y \cap Z|$$

Double Counting Principle

- 1. N = 1, 2, 3, (nodes)
- 2. E = a, b (edges)
- 3. R = incidence

$$|R|$$
 (over the nodes) (8)

 $= |x \in E|$ 1 is incident to $x| + |x \in E|$ 2 is incident to $x| + |x \in E|$ 3 is incident to x|

$$= |a| + |a, b| + |b| \tag{10}$$

$$=4\tag{11}$$

$$|R|$$
 (over the edges) (12)

$$= |x \in N|x \text{ is incident to a}| + |x \in N|x \text{ is incident to b}|$$
 (13)

$$= |1,2| + |2,3| \tag{14}$$

$$=4\tag{15}$$

Lecture 2 (17.10.2018)

Slide 21

Examples

1) The first person may choose among 100 seats, the second among 99 etc. So we have 100*99*...

$$\frac{100!}{(100-95)!},(n)_k\tag{16}$$

2) Let the perls be enumerated by 1 to 1. Then we cut the necklace at the part with number 1. So each assignment of pearls is bijectively mapped to an n-list, where the first element of the list always is the pearl with numbers 1. So these exists (n-1)! possibilities

Slide 24

Example

A card game consists of 52 cards:

- Each car has a suit out of {I, II, III, IV}
- Each card has a value out of {2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A}
- 2 cards form a pair, if they have the same value

How many possibilities exists so that we have among 5 arbitrary cards one pair and 3 cards with each the same value (but other than the pair)?

Solution

- 1) Choose the value of the pairs (13 possibilities)
- 2) Choose the value of the three cards (12 possibilities)
- 3) Choose the suit of the pair (4C2 = 6 possibilities)
- 4) Choose the suit of the other three cards (4C3 = 4 possibilities)

Therefore, we need the product rule:

$$p = 13 * 12 * C(4,2) * C(4,3)$$
(17)

$$=3744$$
 (18)

$$C(n, m_1) * C(n - m_1, m_2) * \dots * C(m_k, m_k)$$
 (19)

$$= \frac{n!}{(n-m_1)!m_1!} * \frac{(n-m_1)!}{(n-m_1-m_2)!m_2!} * \dots * \frac{m_k!}{m_k!(m_k-m_k!)}$$
 (20)

$$= \frac{n!}{m_1! * \dots * m_k!} \tag{21}$$

Lecture 3 (24.10.2018)

Slide 35

The Stirling numbers n,k of first orders it the number of permutation of a n-set with exactly k cycles

Theorem 1.8.4

 $S(n,1)=1,\,S(n,n)=1$ denotes from set n, choosing 1 partition or n partitions results in only one element

Slide 39

Let f, g be the permutation

$$f = \begin{pmatrix} 1 & 2 & 3 & 4 & 5 \\ 2 & 1 & 4 & 5 & 3 \end{pmatrix} \tag{22}$$

$$g = \begin{pmatrix} 1 & 2 & 3 & 4 & 5 \\ 2 & 1 & 4 & 5 & 1 \end{pmatrix}$$
 (23)

then

$$f \circ g = \left(\begin{array}{cccc} 1 & 2 & 3 & 4 & 5 \\ 1 & 4 & 5 & 3 & 2 \end{array}\right) \tag{24}$$

$$g \circ f = \begin{pmatrix} 1 & 2 & 3 & 4 & 5 \\ 3 & 2 & 5 & 1 & 4 \end{pmatrix} \tag{25}$$

This example shows that in general the composition of permutation is not commutative since a permutation is bijective, also the inverse function is a permutation.

Let f be

$$f = \begin{pmatrix} 1 & 2 & 3 & 4 & 5 \\ 2 & 1 & 4 & 5 & 3 \end{pmatrix} \tag{26}$$

First we invert, then we order the first row

$$f^{-1} = \begin{pmatrix} 2 & 1 & 4 & 5 & 3 \\ 1 & 2 & 3 & 4 & 5 \end{pmatrix} = \begin{pmatrix} 1 & 2 & 3 & 4 & 5 \\ 2 & 1 & 5 & 3 & 4 \end{pmatrix}$$
 (27)

$$f\circ f^{-1}=id, f^{-1}\circ f=id \tag{28}$$

Example

Let f be

$$f = \begin{pmatrix} 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 \\ 2 & 4 & 8 & 1 & 5 & 9 & 3 & 7 & 6 \end{pmatrix}$$
 (29)

We take the cycles without repitition:

i. 1:
$$1 \mapsto 2 \mapsto 4 \mapsto 1$$
. The cycle is $(1, 2, 4)$

ii. 3:
$$3 \mapsto 8 \mapsto 7 \mapsto 3$$
. The cycle is $(3, 8, 7)$

iii. 5: $5 \mapsto 5$. The cycle is (5)

iv. 6: $6 \mapsto 9 \mapsto 6$. The cycle is (6,9)

The cycle representation of f is:

$$f = (1, 2, 4) \circ (3, 8, 7) \circ (5) \circ (6, 9) \tag{30}$$

Slide 42

Let f be the permutation which describes the change of sorting:

$$f = \begin{pmatrix} 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 \\ 1 & 5 & 9 & 2 & 6 & 10 & 3 & 7 & 11 & 4 & 8 & 12 \end{pmatrix}$$
 (31)

$$= (2, 5, 6, 10, 4) \circ (3, 9, 11, 8, 7)$$
 (starting the cycle at 2) (32)

Since the two cycles have length 5, the cards are back to its original position after 5 procedures.

Slide 42

Let f be a composition of transpositions:

$$f = \begin{pmatrix} 1 & 2 & 3 & 4 \\ 2 & 3 & 4 & 1 \end{pmatrix} \tag{33}$$

$$= (1, 2, 3, 4) \tag{34}$$

$$= (1,4) \circ (1,3) \circ (1,2) \tag{35}$$

But also adding (3,4) and (4,3) doesn't change the identity:

$$f = (1,4) \circ (4,3) \circ (3,4) \circ (1,3) \circ (1,2) \tag{36}$$

Further Remarks

Generalization of polynomials, where the number of terms is allowed to be infinite. The solution of a combinatorial problem can often be expressed as a sequence u_n . In such cases it is often appropriate to use methods based on the representation of u_n as a power series:

$$U(x) = u_0 + u_1 x + u_2 x^2 + \dots (37)$$

where U(x) is called the generating function for the sequence u_n

Slide 47

Taylor Series

The n-th Taylor polynomial is defined as:

$$T_n f(x, a) = \sum_{k=0}^n \frac{f^{(k)}(a)}{k!} (x - a)^k$$
 (38)

$$= f(a) + f'(a)(x - a) + \frac{f''(a)}{2}(x - a)^{2} + \dots$$
 (39)

In the special case where a=0, then the Taylor series is called Mclaurin series.

$$f(x) = (1+x)^n \tag{40}$$

$$\Rightarrow f^{(k)}(x) \tag{41}$$

$$= (n(1+x)^{n-1})^{(k-1)}$$
(42)

$$= (n(n-1)(1+x)^{n-2})^{(k-2)} * \dots$$
(43)

$$= n(n-1) * (n(1+x)^{n-1})^{(k-1)} * \dots$$
(44)

$$\Rightarrow f^{(k)}(0) = n(n-1)(n-2) * \dots * (n-(k-1))$$
(45)

This is to compute the sequence of coefficients from the generating function. The other way round, given a sequence and then compute the function is easy: sequence

$$\langle f_0, f_1, ... \rangle = F(x) = f_0 x^0 + f_1 x^1 + f_2 x^2 + ...$$
 (46)

$$F(x) = (1+x)^n = \binom{n}{0} + (n,1)x + (n,2)x^2 + \dots$$
 (47)

can be regarded as saying the the generating function for the sequence defined by $u_n = (n, k)$ for any given integer n is $F(x) = (1 + x)^n$

Slide 48

Convolution definition

$$c_k = a_0 b_k + a_1 b_{k-1} + \dots + a_k b_0 \tag{48}$$

Example

Given

$$f(x) = 2 + 3x - 4x^2 \tag{49}$$

$$g(x) = 5 - x + x^3 (50)$$

$$c_0 = a_0 b_0 = 2 * 5 = 10 (51)$$

$$c_1 = a_0 b_1 + a_1 b_0 = (2 * -1) + (3 * 5) = 13$$
(52)

$$c_2 = a_0b_2 + a_1b_1 + a_2b_0 = (2*0) + (3*-1) + (-4*5) = -23$$
 (53)

$$f(x) * g(x) = c_0 + c_1 x^1 + c_2 x^2 + \dots$$
 (54)

Slide 50

Example

Geometrical Series

$$(1-x)\sum_{k=0}^{\infty} x^k \tag{55}$$

$$= \sum_{k=0}^{\infty} x^k - \sum_{k=0}^{\infty} x^{k+1}$$
 (56)

$$=1+\sum_{k=1}^{\infty}x^{k}-\sum_{k=1}^{\infty}x^{k}=1$$
(57)

So (1-x) is inverse to the geometrical series and we get $\sum_{k=0}^{\infty} x^k = \frac{1}{1-x}$

Here are some more generating functions:

$$\sum_{k=0}^{\infty} (-1)^k x^k \tag{58}$$

$$=1-x+x^2-x^3+... (59)$$

$$\hat{=}(1, -1, 1, -1, \dots) \tag{60}$$

$$\sum_{k=0}^{\infty} x^2 k \tag{61}$$

$$= 1 + x^2 + x^4 + x^6 + \dots ag{62}$$

$$\hat{=}(1,0,1,0,1,\dots) \tag{63}$$

Slide 52

$$F_n = F_{n-1} + F_{n-2} \tag{64}$$

The above equation is a homogeneous (no constants) linear recursion equation of second order (going back 2 steps)

Slide 53

Example: Fibonacci Numbers

The main idea now is to expand the right series as a formal power series. To do this we factorize the denominator. We put:

$$1 - x - x^2 = (1 - ax)(1 - bx) \tag{65}$$

If we substitute $x = \frac{1}{y}$, equation (2) is equivalent to

$$1 - \frac{1}{y} - \frac{1}{y^2} = (1 - \frac{a}{y})(1 - \frac{b}{y}) \tag{66}$$

$$\Leftrightarrow y^2 - y - 1 \tag{67}$$

$$= (y-a)(y-b) \tag{68}$$

$$y_{1,2} = \frac{1}{2} + \sqrt{\frac{1}{4} + 1} \tag{69}$$

$$= \frac{1}{2} + \frac{\sqrt{5}}{2} \tag{70}$$

The zeroes of $y^2 - y - 1$ are:

$$a = \frac{1}{2} + \frac{\sqrt{5}}{2}, \quad b = \frac{1}{2} - \frac{\sqrt{5}}{2}$$
 (71)

Now we decompose into partial fractions

$$\frac{1+x}{1-x-x^2} = \frac{\alpha}{(1-ax)} + \frac{\beta}{(1-bx)}$$
 (72)

$$1 + x = \alpha(1 - bx) + \beta(1 - ax) \tag{73}$$

$$1 + x = \alpha + \beta + (-\alpha b - \beta a)x \tag{74}$$

$$\Rightarrow \alpha + \beta = 1, \quad -\alpha b - \beta a = 1 \tag{75}$$

$$\Rightarrow \alpha = \frac{1+a}{-b+a} = \frac{1+a}{\sqrt{5}}, \quad \beta = 1 - \frac{1+a}{\sqrt{5}} = -\frac{1+b}{\sqrt{5}}$$
 (76)

Each summand from the right hand side is now expanded by the sum rule for the geomtrical series:

$$\Rightarrow \frac{1+x}{1-x-x^2} = \frac{1+a}{\sqrt{5}(1-ax)} - \frac{1+b}{\sqrt{5}(1-bx)}$$
 (77)

$$= \frac{1+a}{\sqrt{5}} \sum_{k=0}^{\infty} a^k x^k - \frac{1+b}{\sqrt{5}} \sum_{k=0}^{\infty} b^k x^k$$
 (78)

$$= \sum_{k=0}^{\infty} \left[\frac{1+a}{\sqrt{5}} a^k - \frac{1+b}{\sqrt{5}} b^k \right] x^k \tag{79}$$

$$\Rightarrow F_k = \frac{a^{k+2}}{\sqrt{5}} - \frac{b^{k+2}}{\sqrt{5}} \quad (1 + a = a^2, 1 + b = b^2)$$
 (80)

We can then compute the specific numbers k in F_k :

$$F_2 = \frac{(\frac{1}{2} + \frac{\sqrt{5}}{2})^4}{\sqrt{5}} - \frac{(\frac{1}{2} + \frac{\sqrt{5}}{2})^4}{\sqrt{5}}$$
(81)

$$=3\tag{82}$$

Slide 54

Special case: Fibonacci numbers

$$F_n = F_{n-1} + F_{n-2} \tag{83}$$

So we have $k=0,\,h_k=0,\,\beta_1=-1,\,\beta_2=-1,\,\beta_j=0$ for $3\leq j\leq n$

Remark on the proof 1.10.5

$$p_{n+k} = \sum_{j=0}^{n} a_{n+k-j} \beta_j = 0, \quad \forall k \ge 0$$
 (84)

$$A(x) = a_0 + a_1 x + a_2 x^2 + \dots (85)$$

$$A(x) = \sum_{j=0}^{n} \beta_j x^j \tag{86}$$

$$= a_0 \beta_0 x^0 + (a_0 \beta_1 + a_1 \beta_0) x^1 + (a_0 \beta_2 + a_1 \beta_1 + a_2 \beta_0) x^2 + \dots$$
 (87)

$$= \underbrace{(a_0\beta_n + a_1\beta_{n-1} + \dots + a_n\beta_0)}_{= 0 \text{ due to recursion formula}} x^n$$
(88)

At first we substitute in the equation $1 + \beta_1 x + \beta_2 x^2 + ... = 0$

After multiplication by y^n we get the auxiliary equation:

$$y^{n} + \beta_{1}y^{n-1} + \dots + \beta_{n} = 0 \tag{89}$$

According to the fundemental theorem of algebra, there exists numbers:

$$y_1, ..., y_5 \in \mathbb{C} \tag{90}$$

such that:

$$y^{n} + \beta_{1}y^{n-1} + \dots + \beta_{n} = (y - y_{1})^{m_{1}}(y - y_{2})^{m_{2}} \dots (y - y_{5})^{m_{5}}$$
(91)

and

$$\sum_{j=0}^{5} m_j = n \tag{92}$$

By back substituting, we have:

$$1 + \beta_1 x + \beta_2 x^2 + \dots + \beta_n x^n = x^n (y^n + \beta_1 y^{n-1} + \dots + \beta_n)$$
(93)

$$= x^{n}(y - y_1)^{m_1}(y - y_2)^{m_2}...(y - y_5)^{m_5}$$
 (94)

$$=x^{n}\left(\frac{1}{r}-y_{1}\right)^{m_{1}}\left(\frac{1}{r}-y_{2}\right)^{m_{2}}...\left(\frac{1}{r}-y_{5}\right)^{m_{5}}$$
 (95)

$$= (1 - y_1 x)^{m_1} (1 - y_2 x)^{m_2} ... (1 - y_5)^{m_5}$$
(96)

So:

$$A(x) = \frac{P(x)}{(1 - y_1 x)^{m_1} (1 - y_2 x)^{m_2} \dots (1 - y_5)^{m_5}}$$
(97)

According to the theorem of partial fraction decomposition, it holds:

$$A(x) = \sum_{k=1}^{5} \frac{H_k(x)}{(1 - y_k x)^{m_k}}$$
(98)

with polynomial H_k and $deg(H_k) < m_k$.

Futhermore for each summand holds (omitting index k) due to partial fraction decomposition:

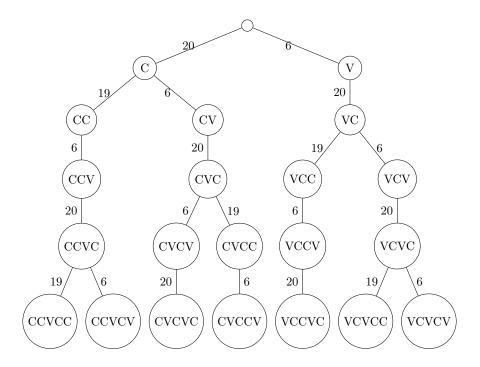

$$\frac{H(x)}{(1-\beta x)^m} = \sum_{j=1}^m \frac{\gamma_j}{(1-\beta x)^j}, \quad \gamma_j \in \mathbb{R}$$
 (99)

Each summand on the right hand sind can now be expanded by means of the geometrical series into a power series.

Lecture 4 (7.11.2018)

Slide 57

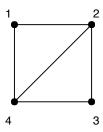

The number of possibilities for the leaves are:

For example: CCVCC: 19*20*6*19*20

Slide 66

Example double counting principle

v\E	$\{1, 2\}$	$\{1, 4\}$	$\{4, 3\}$	${3, 2}$	$\{4, 2\}$	countSum
1	X	X				2
2	X			X	X	3
3			X	X		2
4		X	X		X	3
	2	2	2	2	2	10

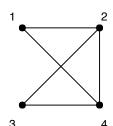

Slide 67

Remark to proof 2.1.4

 $|V_0|$ has to be even because:

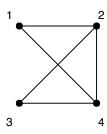

t	even	odd
even	even	odd
odd	odd	even

Slide 69

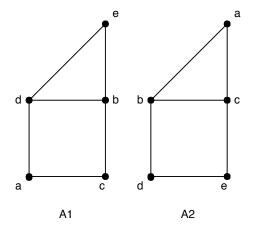

Slide 70

Example adjacency matrix

$$\begin{pmatrix}
0 & 1 & 0 & 1 \\
1 & 0 & 1 & 1 \\
0 & 1 & 0 & 1
\end{pmatrix}$$
(100)

Another adjacency matrix

$$A_{1} = \begin{pmatrix} 0 & 0 & 1 & 1 & 0 \\ 0 & 0 & 1 & 1 & 1 \\ 1 & 1 & 0 & 0 & 0 \\ 1 & 1 & 0 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 \end{pmatrix}$$

$$(101)$$

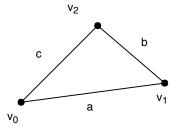

$$A_{2} = \begin{pmatrix} 0 & 1 & 1 & 0 & 0 \\ 1 & 0 & 1 & 1 & 0 \\ 1 & 1 & 0 & 0 & 1 \\ 0 & 1 & 0 & 0 & 1 \\ 0 & 0 & 1 & 1 & 0 \end{pmatrix}$$
 (102)

Remarks to the Proof 2.3.3 (No. 2)

- Here we have the case $\{u,v\} \in E$. So $\{3,2\} \in E, G' = (V',E'), V' = V \cup \{a\}, E' = E \cup \{\{2,a\},\{3,a\}\}$ and a closed Euler line is (1,2,a,3,4,2,3,1)
- Here we have the case $\{u,v\} \notin E$. So $\{1,3\} \notin E$, G' = (V,E'), $E' = E \cup \{\{1,3\}\}$ and a closed Euler line is (1,3,5,4,3,2,1)

Slide 78

Example

a.
$$w = v_0$$
, $F = E = \{a, b, c\}$

b.
$$deg(v_0, F) = 2 \implies v_1 \text{ with } \{v_0, v_1\} \in F, W = (v_0, v_1), F = \{b, c\}$$

c.
$$deg(v_1, F) = 1 \implies v_2 \text{ with } \{v_2, v_1\} \in F, W = (v_0, v_1, v_2), F = \{c\}$$

d.
$$deg(v_2, F) = 1 \implies v_0 \text{ with } \{v_2, v_0\} \in F, W = (v_0, v_1, v_2, v_0), F = \emptyset$$

e.
$$deg(v_0, F) = 0 \implies STOP$$

Lecture 5 (14.11.2018)

Slide 87

The principle of induction

Suppose that P(n) is a statement with the following properties:

- a. P(1) is true (induction basis)
- b. if P(k) is true (induction hypothesis), then P(k+1) is true (induction step) $\forall k \in \mathbb{N}$, then P(n) is true $\forall n \in \mathbb{N}$

Example

Prove that $\forall n \in \mathbb{N}, n^3 + 5n$ is a multiple of 6:

- a. P(1) is true: $1^3 + 5 * 1 = 6$ is a multiple of 6
- b. Suppose that P(k) is true, that is $k^3 + 5k = 6m$, $m \in \mathbb{N}$. We have to deduce that P(k+1) is true.

Inserting

$$n = k+1: (k+1)^3 + 5(k+1)$$
(103)

$$=k^3 + 3k^2 + 3k + 1 + 5k + 5 \tag{104}$$

In order to use the assumption, we rewrite this as follows:

$$(k^3 + 5k) + 3(k^2 + k + 2) = 6m + 3k(k+1) + 6$$
(105)

Now k(k+1) is an even number, say:

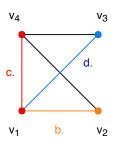

$$2r \Rightarrow 4m + 3k(k+1) + 6 = 6m + 6r + 6$$
 (106)

$$= 6(m+r+1) (107)$$

We have shown that P(1) is true, and that is P(k) is true, then P(k+1) is true. Applying the principle of induction, it follows that P(n) is true $\forall n \in \mathbb{N}$

Slide 89

Example: Generic Algorithm

a. $W = \{v_1\}, F = \emptyset, L = \{(v_1, v_2), (v_1, v_4), (v_1, v_3)\}$ (Choose (v_1, v_2))

b. $W = \{v_1, v_2\}, F = \{\{v_1, v_2\}\}, L = \{(v_2, v_4), (v_1, v_4), (v_1, v_3)\}$ (Choose (v_1, v_4))

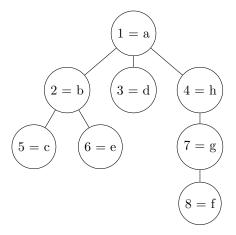

c. $W = \{v_1, v_2, v_4\}, F = \{\{v_1, v_2\}, \{v_1, v_4\}\}, L = \{(v_1, v_3), (v_4, v_3)\}$ (Choose (v_1, v_3))

d. $W = \{v_1, v_2, v_4, v_3\}, \quad F = \{\{v_1, v_2\}, \{v_1, v_4\}, \{v_1, v_3\}\}, \quad L = \emptyset$

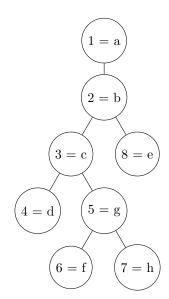

Slide 94

Edge table:

Example: BFS

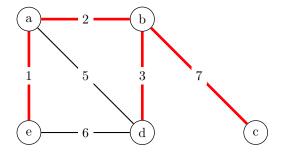

Example: DFS

Slide 99

Example: Prim's Algorithm

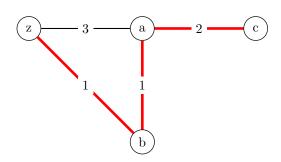

Start with node z = a

- a. add $\{a, e\}$ with cost 1
- b. add $\{a, b\}$ with cost 2
- c. add $\{b,d\}$ with cost 3
- d. add $\{b,c\}$ with cost 7

Lecture 6 (21.11.2018)

Slide 103

Example Dijkstra's Algorithm

- $W = \{z\}, F = \emptyset, L(W, V) = \{(z, a), (z, b)\}$ - $d(z) + w(\{z, a\}) = 0 + 3$
 - $-d(z) + w(\{z, b\}) = 0 + 1$
 - * Choose (z,b)
- $W = \{z, b\}, \quad F = \{\{z, b\}\}, \quad L(W, V) = \{(z, a), (b, a)\}$ - $d(z) + w(\{z, a\}) = 0 + 3$
 - $d(z) + w(\{z, a\}) = 0 + 3$ $d(b) + w(\{b, a\}) = 1 + 1$
 - * Choose (b, a)
- $W = \{z, b, a\}, \quad F = \{\{z, b\}, \{b, a\}\}, \quad L(W, V) = \{(a, c)\}$ - $d(a) + w(\{a, c\}) = 2 + 2$
- $W = \{z, b, a, c\}, \quad F = \{\{z, b\}, \{b, a\}, \{a, c\}\}, \quad L(W, V) = \emptyset$

Remarks to Proof

Per definition, d(u) = l((z, ..., u))

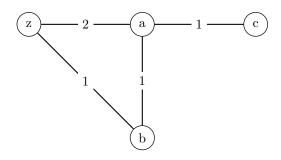

$$d(u) + w(e) \ge d(x) + w(\{x, y\}) \tag{108}$$

is true because we have chosen $\{x,y\}\in L(W,V)$ such that

$$d(x) + w(\{x, y\}) \le d(u) + w(\{u, v\}), \quad \forall (u, v) \in L(W, V)$$
 (109)

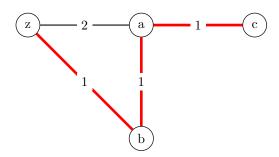

Slide 105

Example: Difference between Prim and Dijsktra

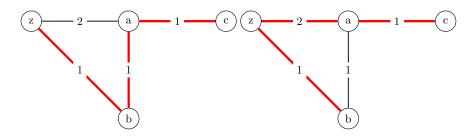

\mathbf{Prim}

$$\{\{z,b\},\{b,a\},\{a,c\}\}$$

Dijsktra

 $\{\{z,b\},\{z,a\} \text{ or } \{b,a\},\{a,c\}\}$

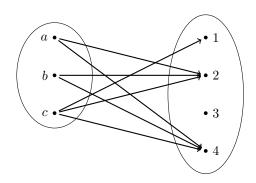

Slide 107

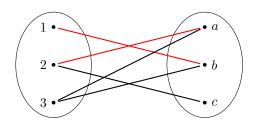

TODO

Slide 111

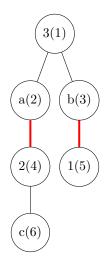

Remarks to the Proof 2.6.5 with $|\mathbf{D}|=1$

- 1. Add one node (4)
- 2. Add edge to node (4) from 1, 2, and 3 3. $d \ge |A| |N(A)|$, because $d = max\{|A| |N(A)| : A \subseteq X\}$

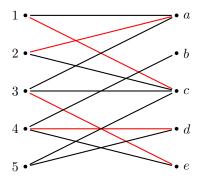

- $\begin{array}{l} \bullet \ \ \mathrm{Matching} = \{\{1,b\},\{2,a\}\} \\ \bullet \ \ \mathrm{Start\ witjh\ node\ (3)} \\ \end{array}$

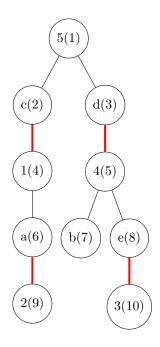

- $\bullet \Rightarrow X_1 = \{1, 2, 3\}$ $\bullet \Rightarrow Y_1 = \{a, b, c\}$

Slide 116

Example

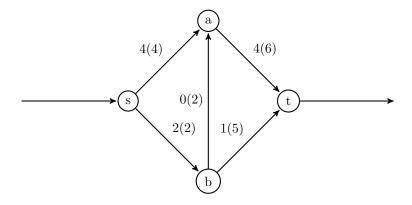

Corresponding BFS-tree: (*) Set $Z:=X\backslash X_M$ - Start with non connected nodes: - Traverse back, we can only go through matching edges

We find the alternating path P=(5,d,4,b). From this we obtain the improved and complete matching $M=\{\{1,c\},\{2,a\},\{3,e\},\{4,b\},\{5,d\}\}$

Slide 120

Example

- For node a, the inflow is 4 + 0, and the outflow is 4, therefore it is valid
- For the whole diagram, the inflow is the same as the outflow.

Remark to 2.7.4 (with diagarm reference of Slide 120)

We use the example with $T = \{a, b, t\}$

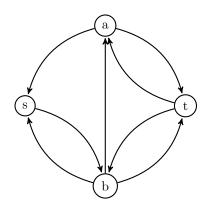

$$\inf(t) = in(t) - 0 + in(a) - out(a) + in(b) - out(b)$$
(110)

$$= f_{ab} + f + bt - 0 + f_{sa} + f_{ba} - f_{at} + f_{sb} - f_{ba} - f_{bt}$$
 (111)

$$=f_{sa}+f_{sb} (112)$$

Augmenting Path

 D_f :

$$P = (s, b, t) \tag{113}$$

$$s \stackrel{2}{\mapsto} b \stackrel{4}{\mapsto} t \Rightarrow \alpha_1 = 2$$
, therefore $\delta = 2$ (114)

New admissable flow:

 D_f :
